Take your first steps to understanding and start working with stream processing! By the end of the course, you will be able to build and run distributed streaming pipelines in Java:

- \* Explain when to use streaming
- \* Design a streaming application from the building blocks
- \* Transform, match, correlate and aggregate continuous data
- \* Scale, deploy, and operate streaming apps

We will also cover the advantages and disadvantages of the stream processing technologies available when approaching real-world problems.
